

Location Org Resolution

Often reporting facilities within a health system will share a common FHIR endpoint with other facilities in the network. Due to query limitations from EHR (Electronic Health Record) systems, there's a risk that NHSNLink may retrieve patient related FHIR resources that don't belong to the reporting facility. To address this, configuration on specific FHIR Location values must be provided to ensure that any patient Encounters that are evaluated for NHSN measures are within the reporting facility. No configuration is needed unless your facility's FHIR data is shared with other facilities in your health system.

Below is an example of the Epic location hierarchy. It's been identified that often the EAF/Hospital Location node represents the reporting facility Location. The `Location.identifier` element of that node has been found as a reliable source for NHSNLink to identify whether the patient Encounter Location belongs to the proper organization for facilities that use Epic. NHSNLink is capable of traversing up from the Encounter location to its parent EAF Location to make this determination:

Facility Structure Hierarchy Overview

Below is an example of a Location resource the represents the reporting facility:

```
{
  "resourceType": "Location",
  "id": "30f80690-2998-46e8-aba7-b117506942a0",
  "meta": {
    "lastUpdated": "2026-06-10T13:01:29.6451745+00:00"
  },
  "identifier": [{
    "system": "urn:oid:1.2.480.135030.1.81.99.6.1.2.650112",
    "value": "10"
  }],
  "status": "active",
  "name": "Memorial Hospital",
  "alias": ["Memorial Hospital"],
  "managingOrganization": {
    "reference": "Organization/bf47f291-f206-4716-bd89-41cc1fa649e7"
  }
}
```

Based on this example, the following **Location Organization Resolution** configuration must be added:

- **Location Identifier System:** urn:oid:1.2.480.135030.1.81.99.6.1.2.650112
- **Location Identifier Code:** 10
